

VALIDATION CERTIFICATE

Pioneer validates that the following soybean products were developed using traditional plant breeding without the use of molecular genetic modification techniques. Pioneer sets seed purity standards to ensure that products purchased by our customers are as pure as possible. Pioneer seed production and testing are conducted under a rigorous quality management system. However, grain traits can be mingled mechanically in the grain handling process or genetically in the course of pollination. Thus 100% purity, either in genetic make-up or in the absence of foreign material content is currently not achievable for any agricultural product, including soybean seed. This certificate also verifies that these products are not available from Pioneer as National Organic Program certified organic seed.
